Bug Notification Support

**Free trials available. Contact AdventureTech today.**

**iConga** is a native iSeries two way messaging system allowing capture, transmittal and remote response to iSeries messages from any email device (including email enabled cell phones.) Multiple iSeries message queues may be monitored simultaneously and independently with multiple recipient rollwait functionality.

\*SYSOPR messages may be answered remotely without the need to dial-in to your iSeries. Explicit iSeries message type subset monitoring, message logging and user level security are inherent to this product. A separate product subsystem ensures application independence and availability.

AdventureTech does **NOT** charge based upon tier or processor size

AdventureTech provides complimentary copies of **iConga** for multiple LPAR's.
